Experiment 2 — Fish Introduction – Dynamic Anchors

A

Patients are matched within block; FA is sampled independently from R.

B

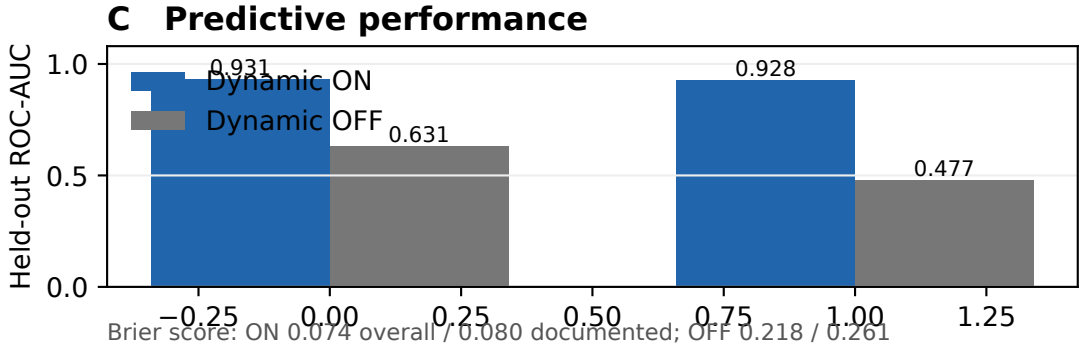

Actual learned dynamic-anchor mechanism (saved ON tree)

node 0 · SUM(FishIntroduction) ≤ 1
window: Birth Date Anchor + 22 month(s) · LEFT 1 / RIGHT 38

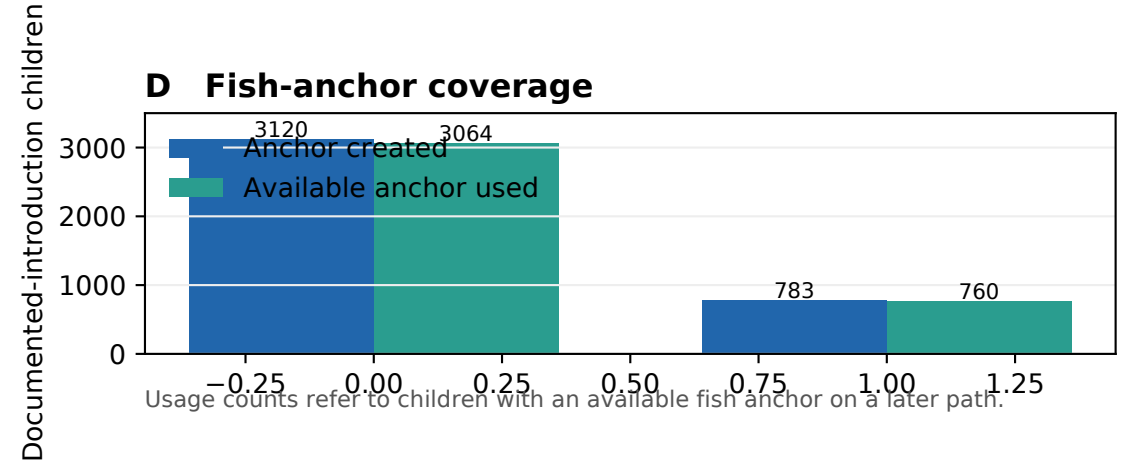

node 1 · SUM(GI) ≤ 1
window: Node 0 | SUM(FishIntroduction) Anchor + 1 month(s) · LEFT 2 / RIGHT 19

node 19 · SUM(Vomiting) ≤ 1
window: Node 0 | SUM(FishIntroduction) Anchor + 1 month(s) · LEFT 20 / RIGHT 31

Node 0 creates the patient-specific fish anchor.
Nodes 1 and 4 then evaluate GI/Vomiting within +1 calendar month of that anchor.
Other saved splits include distractors; this panel reports only nodes that use the fish-derived anchor.

Brier score: ON 0.074 overall / 0.080 documented; OFF 0.218 / 0.261

Usage counts refer to children with an available fish anchor on a later path.

Saved artifacts only. R is the timestamp rule; FA is an independently sampled probabilistic outcome. Metrics are held-out test results.
